Lovesac / Conscia — Task list

Extracted from team call, 27 March 2026 — Sana, David, Laurel

---

Before kickoff meeting

#	Task	Owner	Priority
1	Read and review all documents in the shared drive — solution design, requirements doc, product hierarchy PDF, compatibility rules, kickoff deck, target architecture. Poke holes; Sana expects ~75% accuracy and actively wants critique.	David, Laurel	High
2	Forward the new data file from Amelia (received during the call) to David and Laurel.	Morgan	High
3	Confirm kickoff meeting date, time, and attendees with Amelia. Originally flagged as Monday but likely Tuesday or Wednesday due to Holt Renfrew clash — stagger so both projects don't land simultaneously.	Morgan	High
4	Prepare list of questions to bring to kickoff: (1) How/where will they provide product data — file feed or API endpoint? (2) Can they provide or verify the compatibility rules? (3) What does the target 3-level hierarchy look like exactly?	David, Laurel	High
5	Add architecture diagram (Canva/Mermaid) to the shared drive folder. Sana shared it via Slack during the call but it isn't in the drive yet. Simple diagram showing DX Graph + DX Engine relationship.	Sana	Medium

---

Solution design & documentation

#	Task	Owner	Priority
6	Enrich the solution document with additional architecture diagrams. Use Mermaid (or Excalidraw CLI — David flagged it now supports programmatic/API usage). Show DX Graph + DX Engine working together, plus a "DX Graph only" comparison to justify the DX Engine layer.	David	High
7	Create an internal business sell deck ("inside sell") for Amelia. She needs to go back to her business and IT teams to explain what Conscia is building. Audience is non-technical. Deck should translate technology into business value — cost of errors today, what real-time validation gives them, omnichannel readiness.	David	High

#	Task	Owner	Priority
8	Build a "before vs after" narrative for the sell deck using Lovesac's own pain point: store associate takes an order with an incompatible fabric/component combo → customer called back after leaving the store → bad experience → lost loyalty. Frame as revenue and experience risk, then show what the solution prevents.	David	Medium
9	Update Conscia documentation to clarify that DX Graph supports relationships within the same collection. Sana found that AI-assisted solutioning was confused about this; docs need to make it explicit so it doesn't regress in future.	Sana	Medium

Compatibility rules & data ingestion

#	Task	Owner	Priority
10	Present AI-generated compatibility rules to Amelia for validation. Sana generated these from the 28k-record dataset using Pandas-backed analysis. Risk: Lovesac may not have a formal rules document — all rules are currently hard-coded in Threekits.	Sana	High
11	Ask Lovesac at kickoff: can they export rules from Threekits, or do they need to be derived from data? Current logic is hard-coded in the front-end visualiser. Establish whether any structured export exists, or whether the AI-derived rules are the starting point.	Team	High
12	Establish data ingestion format and cadence with Lovesac. Conscia needs JSON format for ongoing operational ingestion. Clarify: do they have an existing API endpoint, or will they provide file feeds? Source systems are SAP, Magento/Adobe Commerce, and Threekits.	Team	High
13	Start POC: load product data into DX Graph and build initial compatibility relationships. Sana wants to start immediately — enough data exists to show something in ~1 week. Priority 1 is data ingestion + hierarchy. Priority 2 is the DX Engine orchestration layer on top.	David, Laurel	High
14	Align with Lovesac on final 3-level product hierarchy design. They currently have 7 levels and want to flatten to ~3. Fabric was previously a hierarchy level — confirm it becomes an attribute on the product entity, not a level.	Lovesac (Amelia)	Medium

Later / pipeline items

#	Task	Owner	Priority
15	Build DX Engine orchestration flow for real-time configuration validation (POS integration POC). POS will call Conscia in real time to validate a configuration. Target: integration-ready by 30 June. Lovesac unlikely to go live until post-June.	David, Laurel	Medium
16	Write a configurator white paper targeting the automotive vertical. Use the Lovesac solution as a template and publish. Position Conscia as the modern, API-first alternative to legacy CPQ engines. Jaguar is a live prospect.	Sana	Low
17	Share David's AI course with Laurel for feedback once ready (~50% complete).	David	Low
18	Introduce Laurel to Dwayne — to happen week of kickoff (Dwayne is currently in Vegas with Sana).	Sana	Low

---

Key context notes

DX Engine is a freebie for year one. It wasn't in the original scope and Lovesac doesn't have budget for it. Sana committed to giving it at no charge for a year because the solution doesn't work without it. Making the POC impressive is important for converting this into a paid renewal.

Compatibility rules are the critical-path blocker. All current rules are hard-coded in Threekits (the front-end visualiser). Lovesac may have no structured rules document at all. Sana AI-generated a candidate rule set from the product data, but these need business validation before being loaded into DX Graph.

Amelia (VP Consumer Experience, Lovesac) is non-technical. David's primary role is stakeholder translation — making sure Amelia and her business teams understand what is being built and why. She is managing ~10 concurrent projects and needs help aligning her internal teams.

Laurel's role on Lovesac is hands-on solutioning and implementation. Her Holt Renfrew involvement is lighter for now (shadowing, not leading) so Lovesac is her main focus in the near term.
